

Diabetes Progression Prediction

Dataset: `load_diabetes()` from scikit-learn

Objective: Predict disease progression based on patient health measurements.

Features:

- Age
- Sex
- BM I
- Blood Pressure
- 6 blood serum measurements

Target:

- Disease progression score after one year

Tasks

1. Load the dataset.
2. Perform EDA.
3. Check feature correlations.
4. Train a Linear Regression model.
5. Evaluate using R^2 , MAE, RMSE.
6. Identify the most influential features.
7. Compare actual vs predicted values
